Introduction

The Santa-Fe Artificial Stock Market model

Agents model

Modifications of the agents model

Experiments

Conclusion

Introduction

- ▶ understand market dynamics and in particular critical events (bubbles and crashes)

Introduction

- ▶ understand market dynamics and in particular critical events (bubbles and crashes)
- ▶ some theories explain these phenomenoms but with too strong hypotheses (rational expectation)

Introduction

- ▶ understand market dynamics and in particular critical events (bubbles and crashes)
- ▶ some theories explain these phenomenoms but with too strong hypotheses (rational expectation)
- ▶ our approach :
 - ▶ bottom-up approach to relax these hypotheses (bounded rationality)

Introduction

- ▶ understand market dynamics and in particular critical events (bubbles and crashes)
- ▶ some theories explain these phenomenoms but with too strong hypotheses (rational expectation)
- ▶ our approach :
 - ▶ bottom-up approach to relax these hypotheses (bounded rationality)
 - ▶ multi-agents simulations (Santa-Fe Artificial Stock Market)

Introduction

The Santa-Fe Artificial Stock Market model

The original model

Market architecture

Price and dividend calculation

A special value : the fundamental value

Agents model

Modifications of the agents model

Experiments

The original model

- ▶ developed at the *Santa-Fe Institute* (ARTHUR, HOLLAND, LEBARON, PALMER, TAYLER)

The original model

- ▶ developed at the *Santa-Fe Institute* (ARTHUR, HOLLAND, LEBARON, PALMER, TAYLER)
- ▶ goal : prove that inductive agents in bounded rationality can lead to valid market dynamics

The original model

- ▶ developed at the *Santa-Fe Institute* (ARTHUR, HOLLAND, LEBARON, PALMER, TAYLER)
- ▶ goal : prove that inductive agents in bounded rationality can lead to valid market dynamics
- ▶ new result in finance !

Market architecture

- ▶ a stock, which has a current price p_t and yields a dividend d_t

Market architecture

- ▶ a stock, which has a current price p_t and yields a dividend d_t
- ▶ n agents who can choose at each step of time between
 - ▶ buy/sell a share
 - ▶ do nothing

Market architecture

- ▶ a stock, which has a current price p_t and yields a dividend d_t
- ▶ n agents who can choose at each step of time between
 - ▶ buy/sell a share
 - ▶ do nothing
- ▶ agents' cash money is invested in a risk free asset with a fixed interest rate r

Price and dividend calculation

- ▶ p_t is updated according to the number of buyers and sellers :

$$p_t = p_{t-1} + \beta(B_t - O_t)$$

Price and dividend calculation

- ▶ p_t is updated according to the number of buyers and sellers :

$$p_t = p_{t-1} + \beta(B_t - O_t)$$

- ▶ d_t follows a random walk :

$$d_{t+1} = d_t + \epsilon_t$$

A special value : the fundamental value

The fundamental value :

- ▶ can't be observed on a real market

A special value : the fundamental value

The fundamental value :

- ▶ can't be observed on a real market
- ▶ gives the price the stock would have on an ideal market

A special value : the fundamental value

The fundamental value :

- ▶ can't be observed on a real market
- ▶ gives the price the stock would have on an ideal market
- ▶ \Rightarrow allows to know if the stock is over-evaluated of under-evaluated

A special value : the fundamental value

The fundamental value :

- ▶ can't be observed on a real market
- ▶ gives the price the stock would have on an ideal market
- ▶ \Rightarrow allows to know if the stock is over-evaluated or under-evaluated
- ▶ here :

$$fv_t = \frac{d_t}{r}$$

Introduction

The Santa-Fe Artificial Stock Market model

Agents model

Generalities

Market perception

Model limitations

Modifications of the agents model

Experiments

Conclusion

Generalities

- ▶ knowledges : past values of p_t , d_t and fv_t

Generalities

- ▶ knowledges : past values of p_t , d_t and fv_t
- ▶ no knowledge on the generation process of these values

Generalities

- ▶ knowledges : past values of p_t , d_t and fv_t
- ▶ no knowledge on the generation process of these values
- ▶ challenge : maximize the amount of money owned at the end of the simulation

Market perception

- ▶ Each agent has a stock of m rules

Market perception

- ▶ Each agent has a stock of m rules
- ▶ Each rule is a triplet :
 $\{condition, action, strength\}$

Market perception

- ▶ Each agent has a stock of m rules
- ▶ Each rule is a triplet :
 $\{condition, action, strength\}$
- ▶ The *condition* part is composed of indicators which can be: true, false or non-significative.

Indicators

Conditions	1	#	0	$p(t-1) > 200$
	0	#	0	$p(t-1) > 250$
	#	0	1	$p(t-1) > 300$
Action	-1	1	0	
Strength	0.1	0.4	0.2	

Indicators

Conditions	1	#	0	$p(t-1) > 200$
	0	#	0	$p(t-1) > 250$
	#	0	1	$p(t-1) > 300$
Action	-1	1	0	<div style="border: 2px dashed black; padding: 10px;"> market state $p(t-1) = 225$ </div>
Strength	0.1	0.4	0.2	

Conditions	1	#
	0	#
	#	0
Action	-1	1
Strength	0.1	0.4

Number

Strength

0.1

0.4

Model limitations

Several limitations in the original model:

- ▶ agents observe the market with indicators coming from classical theory and speculation theory

Model limitations

Several limitations in the original model:

- ▶ agents observe the market with indicators coming from classical theory and speculation theory
- ▶ agents may not take rational economic decisions

Introduction

The Santa-Fe Artificial Stock Market model

Agents model

Modifications of the agents model

Two types of agents

Rationalization

Experiments

Conclusion

Two types of agents

To improve the original model, we create two new types of agents:

- ▶ Fundamentalists agents : market observation through indicators which use classical economic theory
⇒ arbitration of deviations between the price and the fundamental value

Two types of agents

To improve the original model, we create two new types of agents:

- ▶ Fundamentalists agents : market observation through indicators which use classical economic theory
⇒ arbitration of deviations between the price and the fundamental value
- ▶ Speculator agents : market observation through technical indicators (trends)
⇒ herd behavior

Two types of agents

To improve the original model, we create two new types of agents:

- ▶ Fundamentalists agents : market observation through indicators which use classical economic theory
⇒ arbitration of deviations between the price and the fundamental value
- ▶ Speculator agents : market observation through technical indicators (trends)
⇒ herd behavior
 - ▶ till a certain point...

Speculation limit

- ▶ speculation activity must be bounded

Speculation limit

- ▶ speculation activity must be bounded
- ▶ lack of liquidity make speculators fear and revert their positions (A. Orlean)

Speculation limit

- ▶ speculation activity must be bounded
- ▶ lack of liquidity make speculators fear and revert their positions (A. Orlean)
- ▶ leads to critical events (crashes)

Rationalization

- ▶ for fundamentalists:
 - ▶ if the stock is over evaluated, sell
 - ▶ if the stock is under evaluated, buy
 - ▶ if information is too vague, do nothing

Rationalization

- ▶ for fundamentalists:
 - ▶ if the stock is over evaluated, sell
 - ▶ if the stock is under evaluated, buy
 - ▶ if information is too vague, do nothing
- ▶ for speculators:
 - ▶ if the market is globally *bull*, buy
 - ▶ if the market is globally *bear*, sell
 - ▶ if the market is *stationnary*, do nothing

Introduction

The Santa-Fe Artificial Stock Market model

Agents model

Modifications of the agents model

Experiments

Methods

First experiment: baseline

Fundamentalists & speculators

Conclusion

Methods

- ▶ experiments running during 10000 iterations with 100 agents

Methods

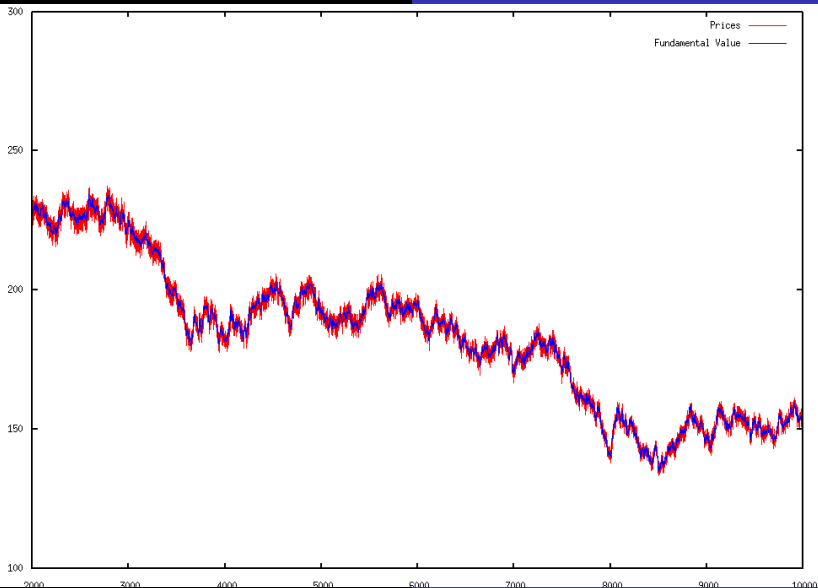

- ▶ experiments running during 10000 iterations with 100 agents
- ▶ most of model parameters are fixed but the proportion of speculator agents

First experiment: baseline

- ▶ experiment without speculator agents

First experiment: baseline

- ▶ experiment without speculator agents
- ▶ is used as a reference to compare with other simulations

Fundamentalists & speculators

- ▶ several experiments run until a critical state is found in the fundamentalists/speculators proportion

Fundamentalists & speculators

- ▶ several experiments run until a critical state is found in the fundamentalists/speculators proportion
- ▶ highly volatile market until a new kind of regim is reached : bubbles & crashes

Fundamentalists & speculators

- ▶ several experiments run until a critical state is found in the fundamentalists/speculators proportion
- ▶ highly volatile market until a new kind of regim is reached : bubbles & crashes
- ▶ after this critical state: market becomes chaotic

Introduction

The Santa-Fe Artificial Stock Market model

Agents model

Modifications of the agents model

Experiments

Conclusion

Conclusion

What next ?

Conclusion

- ▶ market dynamics are close to the ones which can be observed on real markets (statistic proof) with rational agents

Conclusion

- ▶ market dynamics are close to the ones which can be observed on real markets (statistic proof) with rational agents
- ▶ bubbles can appear even if the price dynamics is efficient

Conclusion

- ▶ market dynamics are close to the ones which can be observed on real markets (statistic proof) with rational agents
- ▶ bubbles can appear even if the price dynamics is efficient
- ▶ illustration that speculative behaviors described by Keynes or Orléan can exist on markets

What next ?

- ▶ characterize social relations between market actors to study their influence on market dynamics

What next ?

- ▶ characterize social relations between market actors to study their influence on market dynamics
- ▶ create a new agent to prevent bubbles and crashes (by smoothing liquidity for example)
